 **$\psi(3770)$** 

$I^G(J^{PC}) = 0^-(1^{--})$

Mass  $m = 3773.15 \pm 0.33$  MeVFull width  $\Gamma = 27.2 \pm 1.0$  MeV $\Gamma_{ee} = 0.262 \pm 0.018$  keV (S = 1.4)

In addition to the dominant decay mode to  $D\bar{D}$ ,  $\psi(3770)$  was found to decay into the final states containing the  $J/\psi$  (BAI 05, ADAM 06). ADAMS 06 and HUANG 06A searched for various decay modes with light hadrons and found a statistically significant signal for the decay to  $\phi\eta$  only (ADAMS 06).

 **$\psi(4415)$  [h]**

$I^G(J^{PC}) = 0^-(1^{--})$

Mass  $m = 4421 \pm 4$  MeVFull width  $\Gamma = 62 \pm 20$  MeV $\Gamma_{ee} = 0.58 \pm 0.07$  keV

Due to the complexity of the  $c\bar{c}$  threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective  $\sqrt{s}$  near this particle’s central mass value, more (less) than  $2\sigma$  above zero, without regard to any peaking behavior in  $\sqrt{s}$  or absence thereof. See mode listing(s) for details and references.

## NOTES

[a] For  $E_\gamma > 100$  MeV.

[b] The value is for the sum of the charge states or particle/antiparticle states indicated.

[c] Includes  $p\bar{p}\pi^+\pi^-\gamma$  and excludes  $p\bar{p}\eta$ ,  $p\bar{p}\omega$ ,  $p\bar{p}\eta'$ .[d] See the “Note on the  $\eta(1405)$ ” in the  $\eta(1405)$  Particle Listings.[e] For a narrow state  $A$  with mass less than 960 MeV.[f] For a narrow resonance in the range  $2.2 < M(X) < 2.8$  GeV.

[g] BHARDWAJ 11 does not observe this decay and presents a stronger 90% CL limit than this value. See measurements listings for details.

[h]  $J^{PC}$  known by production in  $e^+ e^-$  via single photon annihilation.  $I^G$  is not known; interpretation of this state as a single resonance is unclear because of the expectation of substantial threshold effects in this energy region.
